

PRODUCT CASE STUDY

Customer-led premises verification

Keep the loan journey digital, even when a physical address or business check is required.

**Digital until the last step**

The final premises check creates back-and-forth.

**Evidence can be weak**

Photos may be unclear, stale or unrelated.

**GOAL**

Let genuine borrowers finish with no manual evidence review.

Product principle: ask for the minimum proof needed, then verify it while the customer is still there.

PRODUCT CASE STUDY

What this step must prove

A submission is only useful if it answers a few concrete questions.

**Current**

Captured now, not a stale image from the gallery.

**At the declared place**

Reasonably consistent with the address the borrower shared.

**Relevant**

Shows the premises we asked the customer to verify.

**Usable**

Clear enough to support a reliable decision.

**Privacy boundary**

Collect the minimum necessary evidence. Avoid turning this into a home walk-through or unnecessary interior capture.

**Customer boundary**

Help genuine borrowers recover from lighting, permission, or connectivity issues.

**Risk boundary**

Do not auto-pass weak or contradictory signals.

PRODUCT CASE STUDY

Different borrowers need different proof

The journey should adapt to what is still unresolved.

Salaried, office-going

Already known

KYC + PAN, salary / bank data, employer details.

Still unresolved

Current residence.

What to verify

Confirm current address + capture home entrance or building context.

Salaried, work from home

Already known

KYC + PAN, salary / bank data, employer details.

Still unresolved

Current residence, not a separate office.

What to verify

Verify home once. Do not manufacture an office check.

Self-employed

Already known

KYC + PAN, bank data, ITR; GST / Udyam if available.

Still unresolved

Residence, and business premises if relevant.

What to verify

Storefront / workplace for a physical business. Use a lighter path for stalls, home businesses, and rural shops.

Product rule: verify the physical claim that is still unresolved, not the entire borrower profile again.

PRODUCT CASE STUDY

One guided session from consent to outcome

The customer should understand what is needed, why it is needed, and how to recover.

Simple steps.
Stronger trust.

- 1 Guide**
Explain why the check is needed, what will be captured, and how long it takes.
- 2 Readiness**
Request one-time camera and location access. Confirm the borrower is at the right place.
- 3 Capture**
Collect the minimum physical evidence needed for that borrower type.

- 4 Review**
Check quality and relevance while the customer is still there. Let them retry immediately if needed.
- 5 Complete or recover**
Verified, retry with a clear reason, or unable to verify digitally.

Presence selfie is conditional. Use it only when session ownership or high-risk handoff needs stronger proof.

PRODUCT CASE STUDY

How much physical evidence is enough?

Define the minimum capture by use case, then step up only when signals are weak.

Residence

1-2 photos

Building entrance or exterior context. Optional flat number if available.

Enough to establish place + usability without over-asking.

Work from home

1-2 photos

Same as residence.

Do not invent a separate office requirement.

Physical business

2 photos

Storefront / signboard + a small amount of business context.

Enough to establish business presence without a full inspection.

Step-up evidence only after normal photo checks fail.

Examples: house number or signboard detail, a second angle, or an optional presence selfie for session ownership. Do not ask for exhaustive interior photos.

Relevant

The capture should answer the exact question for that borrower.

Current

Fresh, live, in-session evidence matters more than volume.

Fair

A home business, roadside stall, or rural shop should still be verifiable without a polished storefront.

PRODUCT CASE STUDY

Fraud resistant, but forgiving for genuine users

The product should separate fixable capture issues from suspicious or contradictory evidence.

Safety by design

Clear rules that prevent fraud while allowing genuine users to recover.

Freshness

Require live capture, not stale uploads.

Location consistency

Compare with the declared address while considering location accuracy.

Relevance

Detect wrong scene types or contradictory evidence.

Escalation discipline

Uncertain evidence should not auto-pass.

Support can help the customer complete the digital journey, but not manually approve the evidence.

MVP assumption: quality retries 3, location retries 2, relevance retry 1.

Helpful recovery states

Guide users through common, fixable issues and keep them moving.

PRODUCT CASE STUDY

Ship narrow, learn safely, then scale

Start with home and physical-business premises verification.

1

**Shadow**

Run automated decisions beside today's process.

2

**Auto-pass**

Automatically pass high-confidence cases.

3

**Scale**

Expand after tuning retries and thresholds.

Success metrics

**Completion**

Percent of requested checks completed

**First attempt**

Verified without a retry

**Time**

Median time from start to outcome

**Risk / ops**

False accept, false reject, repeat requests

TARGET

Manual evidence review = 0

This is the MVP. We start with home and physical-business premises verification, and expand the boundary only after we prove the experience.
