

Designing Swish for people who order way too often

A weekend prototype about the small decisions I repeat every time I order.

Nayana • Product concept • October 2026

Who I had in mind

THE CUSTOMER

Someone in Bengaluru who lives alone, orders several times a week and switches between a PG and work.

What repeats

The address, the meal, the delivery time and the receipt download.

THE QUESTION

Could Swish make those repeat decisions easier without adding more to browse?

What I chose to focus on

I order the same things, to the same places.

The prototype uses those habits to make the next order quicker to set up, while keeping the food menu easy to scan.

Address when choosing a location

Timing when setting delivery

Price comparison inside GO

Visual direction: Swish's green palette, compact cards and simple menu layout.

Saved addresses

THE FRICTION

I still have to check whether the selected address can receive an order.

Put the default and serviceability status beside each saved address.

ADDRESS ON HOME

SAVED ADDRESSES

Delivery timing

THE FRICTION

“Now” works when I am hungry now. It does not help me plan around a meeting.

Show an arrival window. If a later slot costs less, say so clearly.

ORDERING NOW

CHOOSING ARRIVAL

Meal routines

The screenshot shows a mobile app interface for setting a meal routine. At the top, a dark green header bar displays the time '12:03' and a heart icon. Below this is a white bar with a back arrow and the text 'Set a routine'. The main form is divided into sections: 'When' with three tabs ('Every day', 'Weekdays', 'Custom days'), 'Time' with a text input '08:45 AM' and a clock icon, 'Where' with a dropdown menu showing 'PG', and 'What happens' with two radio button options: 'Remind me' (selected) and 'Auto-order'. Each option has a descriptive subtext. At the bottom, there is a large green 'Save routine' button and a small black banner for 'Edit with Lovable'.

WHY I DESIGNED IT THIS WAY

I might want the same breakfast on weekdays, but I do not want a fixed subscription.

A routine can remind me or place the order unless I skip. Days, time and address stay editable.

The trade-off

Setup takes a few steps, so I kept it outside the main order flow.

A clearer GO price comparison

THE QUESTION

**“Other apps ₹230-253”
makes me ask: compared
with which order?**

THE IDEA

Compare my past bills with close
GO matches. Show when GO costs
more, or when there is no fair match.

Receipts and notifications

Bulk receipts

Export a month of receipts for work claims instead of downloading them one by one.

Notification control

Choose which updates arrive by push or WhatsApp. Turn offers off.

Ideas I would keep small

Neighbourhood Drops

A limited local menu could be interesting. I would keep it separate from the regular menu and test demand first.

Assistant shortcuts

An assistant could help build a cart from a request. The user should confirm before any order is placed.

Where I would start

1 **Saved address defaults**

Frequent, basic friction. The change fits where users already choose an address.

2 **Arrival time**

Useful for planned meals. It needs reliable delivery windows before any savings promise.

3 **Routines and Price Proof**

Routines depend on timing and notification controls. Price Proof needs trustworthy matching and bill handling.

What I would validate

USER BEHAVIOUR

Do frequent users repeat the same dishes and locations often enough for defaults or routines to matter?

Interview frequent customers and review repeat-order patterns before making these features prominent.

PRODUCT TRUST

Will people trust a price comparison built from their own bills?

Test upload willingness, match accuracy and whether showing a higher GO price increases confidence in the comparison.

What I took from the exercise

I wanted Swish to help with the parts of ordering I repeat.

The prototype is a starting point. The next step is to see which of these frictions other frequent customers actually share.
